COMMISSION IMPLEMENTING REGULATION (EU) 2017/2470
of 20 December 2017

establishing the Union list of novel foods in accordance with Regulation (EU) 2015/2283 of the European Parliament and of the Council on novel foods

(Text with EEA relevance)

THE EUROPEAN COMMISSION,

Having regard to the Treaty on the Functioning of the European Union,

Whereas:

(1) Regulation (EU) 2015/2283 lays down rules for the placing on the market and use of novel foods within the Union.

(2) Pursuant to Article 8 of Regulation (EU) 2015/2283, the Commission has to establish the Union list of novel foods authorised or notified under Regulation (EC) No 258/97 of the European Parliament and of the Council (2).

(3) The Union list of novel foods is to apply without prejudice to other provisions laid down in sector specific legislation.

(4) The measures provided for in this Regulation are in accordance with the opinion of the Standing Committee on Plants, Animals, Food and Feed,

HAS ADOPTED THIS REGULATION:

Article 1
Union list of authorised novel foods

The Union list of novel foods authorised to be placed on the market within the Union as referred to in Article 6(1) of Regulation (EU) 2015/2283 is hereby established and set out in the Annex to this Regulation.

Article 2

This Regulation shall enter into force on the twentieth day following that of its publication in the Official Journal of the European Union.

This Regulation shall be binding in its entirety and directly applicable in all Member States.

Done at Brussels, 20 December 2017.

For the Commission
The President
Jean-Claude JUNCKER

Content of the list

1. The Union list shall consist of Tables 1 and 2.

2. Table 1 includes the authorised novel foods and contains the following information:
   - Column 1: Authorised novel food
   - Column 2: Conditions under which the novel food may be used. This column is further subdivided into two; Specified food category and Maximum levels
   - Column 3: Additional specific labelling requirements
   - Column 4: Other requirements

3. Table 2 includes the specifications on novel foods and contains the following information:
   - Column 1: Authorised novel food
   - Column 2: Specifications
### Table 1: Authorised novel foods

| **N-Acetyl-D-neuraminic acid** | **Description:**  
N-Acetyl-D-neuraminic acid is a white to off-white crystalline powder  
**Definition:**  
**Chemical name:**  
IUPAC names:  
N-Acetyl-D-neuraminic acid (dihydrate)  
5-Acetamido-3,5-dideoxy-D-glycero-D-galacto-non-2-ulopyranosonic acid (dihydrate),  
**Synonyms:**  
Sialic acid (dihydrate)  
**Chemical formula:**  
\( C_{11}H_{19}NO_9 \) (acid)  
\( C_{11}H_{23}NO_{11} \) (\( C_{11}H_{19}NO_9 \) * 2H₂O) (dihydrate)  
**Molecular mass:**  
309,3 Da (acid)  
345,3 (309,3 + 36,0) (dihydrate)  
**CAS No.:**  
131-48-6 (free acid)  
50795-27-2 (dihydrate)  
**Specifications:**  
Description: white to off-white crystalline powder  
\( \text{pH} \) (20 °C, 5 % solution): 1,7 – 2,5  
N-Acetyl-D-neuraminic acid (dihydrate): > 97,0 %  
Water (dihydrate calculates to 10,4 %): ≤ 12,5 % (w/w)  
Ash, sulphated: < 0,2 % (w/w)  
Acetic acid (as free acid and/or sodium acetate): < 0,5 % (w/w)  
**Heavy Metals:**  
Iron: < 20,0 mg/kg  
Lead: < 0,1 mg/kg  
Residual proteins: < 0,01 % (w/w) |
Residual solvents:
- 2-Propanol: < 0.1 % (w/w)
- Acetone: < 0.1 % (w/w)
- Ethyl acetate: < 0.1 % (w/w)

Microbiological criteria:
- *Salmonella*: Absence in 25 g
- Aerobic mesophilic total count: < 500 CFU/g
- Enterobacteriaceae: Absence in 10 g
- *Cronobacter (Enterobacter) sakazakii*: Absence in 10 g
- *Listeria monocytogenes*: Absence in 25 g
- *Bacillus cereus*: < 50 CFU/g
- Yeasts: < 10 CFU/g
- Moulds: < 10 CFU/g
- Residual endotoxins: < 10 EU/mg

CFU: Colony Forming Units; EU: Endotoxin Units.

---

**Adansonia digitata** (Baobab) dried fruit pulp

Description/Definition:
The Baobab (**Adansonia digitata**) fruits are harvested from trees. The hard shells are cracked open and the pulp is separated from the seeds and the shell. This is milled, separated into coarse and fine lots (particle size 3 to 600 µ) and then packaged.

Typical nutritional components:
- Moisture (loss on drying) (g/100 g): 4,5-13,7
- Protein (g/100 g): 1,8-9,3
- Fat (g/100 g): 0-1,6
- Total carbohydrate (g/100 g): 76,3-89,5
- Total sugars (as glucose): 15,2-36,5
- Sodium (mg/100 g): 0,1-25,2

Analytical specifications:
- Foreign matter: Not more than 0,2 %
- Moisture (loss on drying) (g/100 g): 4,5-13,7
- Ash (g/100 g): 3,8-6,6

| **Antarctic Krill oil from Euphausia superba** | **Description/Definition:** To produce lipid extract from Antarctic Krill (*Euphausia superba*) deep-frozen crushed krill or dried krill meal is subjected to lipid extraction with an approved extraction solvent (under Directive 2009/32/EC). Proteins and krill material are removed from the lipid extract by filtration. The extraction solvents and residual water are removed by evaporation.  
Saponification value: ≤ 230 mg KOH/g  
Peroxide value (PV): ≤ 3 meq O₂/kg oil  
Moisture and volatiles: ≤ 3 % or 0,6 expressed as water activity at 25 °C  
Phospholipids: 35-50 %  
Trans-fatty acids: ≤ 1 %  
EPA (eicosapentaenoic acid): ≥ 9 %  
DHA (docosahexaenoic acid): ≥ 5 % |
| **Antarctic Krill oil rich in phospholipids from Euphausia superba** | **Description/Definition:** Oil rich in phospholipids is produced from Antarctic krill (*Euphausia superba*) by repeated solvent washings with an approved solvent (under Directive 2009/32/EC) to increase phospholipid content of the oil. Solvents are removed from the final product by evaporation.  
Saponification value: ≤ 230 mg KOH/g  
Peroxide value (PV): ≤ 3 meq O₂/kg oil  
Oxidative stability: All food products containing Antarctic Krill oil rich in phospholipids from *Euphausia superba* should demonstrate oxidative stability by appropriate and recognised national/international test methodology (e.g. AOAC).  
Moisture and volatiles: ≤ 3 % or 0,6 expressed as water activity at 25 °C  
Phospholipids: ≥ 60 %  
Trans-fatty acids: ≤ 1 %  
EPA (eicosapentaenoic acid): ≥ 9 %  
DHA (docosahexaenoic acid): ≥ 5 % |
| **Arachidonic acid-rich oil from the fungus Mortierella alpina** | **Description/Definition:** The clear yellow arachidonic acid-rich oil is obtained by fermentation of the non-genetically modified strains IS-4, I49-N18 and FJKR-MA01 of the fungus *Mortierella alpina* using a suitable liquid. The oil is then extracted from the biomass and purified.  
Arachidonic acid: ≥ 40 % by weight of the total fatty acid content  
Free fatty acids: ≤ 0,45 % of the total fatty acid content  
Trans fatty acids: ≤ 0,5 % of the total fatty acid content  
Unsaponifiable matter: ≤ 1,5 % |
### Argan oil from Argania spinosa

**Description/Definition:**
Argan oil is the oil obtained by cold pressing of the almond like kernels of the fruits of *Argania spinosa* (L.) Skeels. Kernels may be roasted prior to pressing, but with no direct contact with a flame.

**Composition:**
- Palmitic acid (C16:0): 12-15 %
- Stearic acid (C18:0): 5-7 %
- Oleic acid (C18:1): 43-50 %
- Linoleic acid (C18:2): 29-36 %
- Unsaponifiable matter: 0,3-2 %
- Total sterols: 100-500 mg/100 g
- Total tocopherols: 16-90 mg/100 g
- Oleic acidity: 0,2-1,5 %
- Peroxide value: < 10 meq O₂/kg

### Astaxanthin-rich oleoresin from Haematococcus pluvialis algae

**Description/Definition:**
Astaxanthin is a carotenoid produced by *Haematococcus pluvialis* algae. Production methods for the growth of the algae are variable: using closed systems exposed to sunlight or strictly controlled illuminated light alternatively open ponds may be used. The algal cells are harvested and dried; the oleoresin is extracted using either super critical CO₂ or a solvent (ethyl acetate). The Astaxanthin is diluted and standardized to 2,5 %, 5,0 %, 7,0 %, 10 %, 15 % or 20 % using olive oil, safflower oil, Sunflower oil or MCT (Medium Chain Triglycerides).

**Composition of the Oleoresin:**
- Fat: 42,2- 99 %
- Protein: 0,3-4,4 %
- Carbohydrate: 0-52,8 %
- Fibre: < 1,0 %
- Ash: 0,0-4,2 %
- Specification of Carotenoids w/w%
  - Total Astaxanthins: 2,9-11,1 %

**Basil seeds (Ocimum basilicum)**

**Description/Definition:**
Basil (*Ocimum basilicum* L.) belongs to the family ‘Lamiaceae’ within the order ‘Lamiales’. Post-harvest the seeds are cleaned mechanically. Flowers, leaves and other parts of the plant are removed. Highest level of purity of Basil seeds has to be ensured by filtering (optical, mechanical). Production process of fruit juice and fruit/vegetable blend beverages containing Basil seeds (*Ocimum basilicum* L.) includes seed pre-hydration and pasteurisation steps. Microbiological controls and monitoring systems are in place.

**Bovine lactoferrin**

**Description/Definition:**
Bovine lactoferrin is a protein that occurs naturally in cows' milk. It is an iron-binding glycoprotein of approximately 77 kDa and consists of a single polypeptide chain of 689 amino acids.

Production process: Bovine lactoferrin is isolated from skimmed milk or cheese whey via ion exchange and subsequent ultra-filtration steps. Finally it is dried by freeze drying or spraying and the large particles are sieved out. It is a virtually odourless, light pinkish powder.

**Physical-Chemical properties of Bovine lactoferrin:**
- Moisture: < 4,5 %
- Ash: < 1,5 %
- Arsenic: < 2,0 mg/kg
- Iron: < 350 mg/kg
- Protein: > 93 %
  - of which bovine lactoferrin: > 95 %
  - of which other proteins: < 5,0 %
- pH (2 % solution, 20 °C): 5,2-7,2
- Solubility (2 % solution, 20 °C): complete

**Chewing gum base (Methyl vinyl ether-maleic anhydride copolymer)**

**Description/Definition:**
Methyl vinyl ether-maleic anhydride copolymer is an anhydrous copolymer of methyl vinyl ether and maleic anhydride.

Free-flowing, white to white-off powder

**CAS No:** 9011-16-9

**Purity:**
- Assay value: At least 99.5 % in dry matter
- Specific viscosity (1 % MEK): 2-10
- Residual methyl vinyl ether: ≤ 150 ppm
- Residual maleic anhydride: ≤ 250 ppm
- Acetaldehyde: ≤ 500 ppm
- Methanol: ≤ 500 ppm
- Dilauroyl peroxide: ≤ 15 ppm
- Total heavy metals: ≤ 10 ppm

**Microbiological criteria:**
- Total aerobic plate count: ≤ 500 CFU/g
- Mould/yeast: ≤ 500 CFU/g
- *Escherichia coli*: Negative to test
- *Salmonella*: Negative to test
- *Staphylococcus aureus*: Negative to test
- *Pseudomonas aeruginosa*: Negative to test
### Chia oil from *Salvia hispanica*

**Description/Definition:**
Chia oil is produced from Chia (*Salvia hispanica L.*) seeds (99.9 % pure) by cold-pressing. No solvents are used and, once pressed, the oil is held in decantation tanks and a filtration process employed to remove impurities. It can also be produced by extraction with supercritical CO$_2$.

**Production process:**
Produced by cold pressing. No solvents are used and, once pressed, the oil is held in decantation tanks and a filtration process employed to remove impurities.

Acidity expressed as oleic acid: ≤ 2.0 %
Peroxide value: ≤ 10 meq/kg
Insoluble impurities: ≤ 0.05 %
Alpha linolenic acid: ≥ 60 %
Linoleic acid: 15-20 %

### Chia seeds (*Salvia hispanica*)

**Description/Definition:**
Chia (*Salvia hispanica L.*) is a summer annual herbaceous plant belonging to the Labiatae family. Post-harvest the seeds are cleaned mechanically. Flowers, leaves and other parts of the plant are removed.

Dry matter: 90-97 %
Protein: 15-26 %
Fat: 18-39 %
Carbohydrate (*): 18-43 %
Crude Fibre (**:): 18-43 %
Ash: 3-7 %

(*) Carbohydrates include the fibre value (EU: carbohydrates are available = sugar + starch)
(**) Crude fibre is the part of fibre made mainly of indigestible cellulose, pentosans and lignin

**Production process:**
Production process of fruit juices and fruit juice blends beverages, containing Chia seeds, includes seed pre-hydration and pasteurisation steps. Microbiological controls and monitoring systems are in place.

### Chitin-glucan from *Aspergillus niger*

**Description/Definition:**
Chitin-glucan is obtained from the mycelium of *Aspergillus niger*; it is a slightly yellow, odourless, free-flowing powder. It has a dry matter content of 90 % or more.

Chitin-glucan is composed largely of two polysaccharides:
- chitin, composed of repeating units of N-acetyl-D-glucosamine (CAS No: 1398-61-4),
- beta (1, 3)-glucan, composed of repeating units of D-glucose (CAS No: 9041-22-9).
**Chitin-glucan complex from **
*Fomes fomentarius*

**Description/Definition:**
Chitin-glucan complex is obtained from the cell walls of the fruit bodies of the fungus *Fomes fomentarius*. It consists primarily of two polysaccharides:
- Chitin, composed of repeating units of N-acetyl-D-glucosamine (CAS No: 1398-61-4);
- Beta-(1,3)(1,6)-D-glucan, composed of repeating units of D-glucose (CAS No: 9041-22-9).

The production process consists of several steps, including: cleaning, reduction in size and grinding, softening in water and heating in an alkaline solution, washing, drying. No hydrolysis is applied during the production process.

**Appearance:** Powder, odourless, flavourless, brown

**Purity:**
- Moisture: ≤ 15 %
- Ash: ≤ 3,0 %
- Chitin-glucan: ≥ 90 %
- Ratio of chitin to glucan: 70:20
- Total carbohydrates, excluding glucans: ≤ 0,1 %

**Chitosan extract from fungi**  
(*Agaricus bisporus; Aspergillus niger*)

**Description/Definition:**
The chitosan extract (containing mainly poly(D-glucosamine)) is obtained from stems of *Agaricus bisporus* or from the mycelium of *Aspergillus niger*.

The patented production process consists of several steps, including: extraction and deacetylation (hydrolysis) in alkaline medium, solubilisation in acidic medium, precipitation in alkaline medium, washing and drying.

**Synonym:** Poly(D-glucosamine)

**Chitosan CAS number:** 9012-76-4

**Chitosan formula:** \((C_6H_11NO_4)_n\)

**Appearance:** fine free-flowing powder

**Aspect:** Off – white to slightly brownish

**Odour:** Odourless

**Purity:**
- Chitosan content (% w/w dry weight): 85
- Glucan content (% w/w dry weight): ≤ 15
- Loss on drying (% w/w dry weight): ≤ 10
- Viscosity (1 % in 1 % acetic acid): 1-15
- Degree of acetylation (in % mol/wet weight): 0-30
- Viscosity (1 % in 1 % acetic acid) (mP a.s): 1-14 for chitosan from *Aspergillus niger*; 12-25 for chitin from *Agaricus bisporus*
- Ash (% w/dry weight): ≤ 3.0
- Proteins (% w/dry weight): ≤ 2.0
- Particle size: > 100 nm
- Taped density (g/cm³): 0.7-1.0
- Fat binding capacity 800 × 9 w/wet weight): pass

**Chondroitin sulphate**

**Description/Definition:**
Chondroitin sulphate (sodium salt) is a biosynthetic product. It is obtained by chemical sulphation of chondroitin derived from fermentation by the bacterium *Escherichia coli* O3:K4:H4 strain U1-41 (ATCC 24502).

Chondroitin sulphate (sodium salt) (% dry basis): 95-105

MWw (weight avg.) (kDa): 5-12

MWN (number avg.) (kDa): 4-11

Dispersion (w:w0,01): ≤ 0,7

Sulphation pattern (ΔDi-6S) (%): ≤ 85

Loss on drying (% (105 °C to constant weight): ≤ 10,0

Residue on ignition (% dry basis): 20-30

Protein (% dry basis): ≤ 0,5

Endotoxins (EU/mg): ≤ 100

Total organic impurities (mg/kg): ≤ 50

**Chromium Picolinate**

**Description/Definition:**
Chromium picolinate is a reddish free-flowing powder, slightly soluble in water at pH 7. The salt is also soluble in polar organic solvents.

Chemical name: tris(2pyridinecarboxylato-N,O)chromium(III) or 2-pyridinecarboxylic acid chromium(III) salt

CAS No.: 14639-25-9

| **Citicoline (synthetic)** | Description/Definition:  
Citicoline is composed of cytosine, ribose, pyrophosphate and choline.  
White crystalline powder  
Chemical name: Choline cytidine 5’-pyrophosphate, Cytidine 5’-(trihydrogen diphosphate) P’-[2-(trimethylammonio)ethyl]ester inner salt  
Chemical formula: C₁₄H₂₆N₄O₁₁P₂  
Molecular weight: 488.32 g/mol  
CAS No.: 987-78-0  
pH (sample solution of 1 %): 2.5-3.5  
Purity:  
Assay value: ≥ 98 % of dry matter  
Loss on drying (100 °C for 4 hours): ≤ 5.0 %  
Ammonium: ≤ 0.05 %  
Arsenic: Not more than 2 ppm  
Free phosphoric acids: ≤ 0.1 %  
5’-Cytidylc acid: ≤ 1.0 %  
**Microbiological criteria:**  
Total plate count: ≤ 10³ CFU/g  
Yeast and moulds: ≤ 10² CFU/g  
*Escherichia coli:* Absence in 1 g  
**Citicoline (microbial source)**  
Description/Definition:  
It is produced by fermentation using a genetically modified strain of *E. coli* (BCT19/p40k)  
The specification on citicoline from the microbial source is identical to the authorised synthetic citicoline. |
| Clostridium butyricum | Description/Definition:  
*Clostridium butyricum* (CBM-588) is a Gram-positive, spore-forming, obligate anaerobic, non-pathogenic, non-genetically modified bacterium. Depository number FERM BP-2789  
**Microbiological criteria:**  
Total viable aerobic count: ≤ 10³ CFU/g  
*Escherichia coli:* Not detected in 1 g |

**Extract of defatted cocoa powder**

- **Cocoa (Theobroma cacao L.) Extract**
  - Appearance: Dark brown powder free of visible impurities
  - Physical and chemical properties:
    - Polyphenol content: Min 55.0 % GAE
    - Theobromine content: Max 10.0 %
    - Ash content: Max 5.0 %
    - Moisture content: Max 8.0 %
    - Bulk density: 0.40-0.55 g/cm³
    - pH: 5.0-6.5
    - Residual solvent: Max 500 ppm

**Low fat cocoa extract**

- **Low fat Cocoa (Theobroma cacao L.) extract**
  - Appearance: Dark red to purple powder
  - Cocoa extract, concentrate: Min 99 %
  - Silicon dioxide (technological aid): Max 1.0 %
  - Cocoa flavanols: Min. 300 mg/g
  - (-) Epicatechin: Min. 45 mg/g
  - Loss on drying: Max. 5.0 %

**Coriander seed oil from Coriandrum sativum**

- **Description/Definition:**
  - Coriander seed oil is an oil containing glycerides of fatty acids that is produced from the seeds of the coriander plant Coriandrum sativum L.
  - Slight yellow colour, bland taste
  - CAS No.: 8008-52-4
  - Composition of fatty acids:
    - Palmitic acid (C16:0): 2-5 %
    - Stearic acid (C18:0): < 1.5 %
    - Petroselinic acid (cis-C18:1(n-12)): 60-75 %
    - Oleic acid (cis-C18:1 (n-9)): 8-15 %

**Crataegus pinnatifida dried fruit**

**Description/Definition:**
Dried fruits of *Crataegus pinnatifida* species belonging to the *Rosaceae* family and native to north China and Korea.

**Composition:**
- Dry matter: 80 %
- Carbohydrates: 55 g/kg fresh weight
- Fructose: 26.5–29.3 g/100 g
- Glucose: 25.5–28.1 g/100 g
- Vitamin C: 29.1 mg/100 g fresh weight
- Sodium: 2.9 g/100 g fresh weight

Compotes are products obtained by thermal processing of the edible part of one or several species of fruits, whole or in pieces, sieved or not, without significant concentration. Sugars, water, cider, spices and lemon juice may be used.

**α-cyclodextrin**

**Description/Definition:**
A non-reducing cyclic saccharide consisting of six α-1,4-linked D-glucopyranosyl units produced by the action of cyclodextrin glucosyltransferase (CGTase, EC 2.4.1.19) on hydrolyzed starch. Recovery and purification of α-cyclodextrin may be carried out using one of the following procedures: precipitation of a complex of α-cyclodextrin with 1-decanol, dissolution in water at elevated temperature and re-precipitation, steam-stripping of the complexant, and crystallisation of α-cyclodextrin from the solution; or chromatography with ion-exchange or gel filtration followed by crystallisation of α-cyclodextrin from the purified mother liquor; or membrane separation methods such as ultra-filtration and reverse osmosis. Description: Virtually odourless, white or almost white crystalline solid.

**Synonyms:** α-cyclodextrin, α-dextrin, cyclohexaamyllose, cyclomaltohexaose, α-cycloamylase

**Chemical name:** Cyclohexaamyllose
CAS No.: 10016-20-3
Chemical formula: \((C_6H_{10}O_5)_n\)
Formula weight: 972.85
Assay: ≥ 98 % (dry basis)

Identification:
Melting range: Decomposes above 278 °C
Solubility: Freely soluble in water; very slightly soluble in ethanol
Specific rotation: [α]D 25: Between + 145° and +151° (1 % solution)
Chromatography: The retention time for the major peak in a liquid chromatogram of the sample corresponds to that for α-cyclodextrin in a chromatogram of reference α-cyclodextrin (available from Consortium für Elektrochemische Industrie GmbH, München, Germany or Wacker Biochem Group, Adrian, MI, USA) using the conditions described in the METHOD OF ASSAY

Purity:
Water: ≤ 11 % (Karl Fischer Method)
Residual complexant: ≤ 20 mg/kg
(1-decanol)
Reducing substances: ≤ 0.5 % (as glucose)
 Sulphated ash: ≤ 0.1%
Lead: ≤ 0.5 mg/kg

Method of assay:
Determine by liquid chromatography using the following conditions:
Sample solution: Weigh accurately about 100 mg of test sample into a 10 ml volumetric flask and add 8 ml of deionised water. Dissolve the sample completely using an ultra-sonification bath (10-15 min) and dilute to the mark with purified deionised water. Filter through a 0.45-micrometer filter.
Reference solution: Weigh accurately about 100 mg of α-cyclodextrin into a 10 ml volumetric flask and add 8 ml of deionised water. Dissolve the sample completely using an ultra-sonification bath and dilute to the mark with purified deionised water.
Chromatography: Liquid chromatograph equipped with a refractive index detector and an integrating recorder. Column and packing: Nucleosil-100-NH\(_2\) (10 µm) (Macherey & Nagel Co. Düren, Germany) or similar
Length: 250 mm
Diameter: 4 mm
Temperature: 40 °C
Mobile phase: acetonitrile/water (67/33, v/v)
Flow rate: 2.0 ml/min
Injection volume: 10 µl
Procedure: Inject the sample solution into the chromatograph, record the chromatogram, and measure the area of the α-CD peak. Calculate the percentage of α-cyclodextrin in the test sample as follows:

% α-cyclodextrin (dry basis) = 100 × (AS/AR) × (WR/WS)

where

As and AR are the areas of the peaks due to α-cyclodextrin for the sample solution and reference solution, respectively. Ws and WR are the weights (mg) of the test sample and reference α-cyclodextrin, respectively, after correcting for water content.

**γ-cyclodextrin**

**Description/Definition:**
A non-reducing cyclic saccharide consisting of eight α-1,4-linked D-glucopyranosyl units produced by the action of cyclodextrin glucosyltransferase (CGTase, EC 2.4.1.19) on hydrolysed starch. Recovery and purification of γ-cyclodextrin may be carried out by precipitation of a complex of γ-cyclodextrin with 8-cyclohexadecen-1-one, dissolution of the complex with water and n-decane, steam-stripping of the aqueous phase and recovery of gamma-CD from the solution by crystallisation.

Virtually odourless, white or almost white crystalline solid

Synonyms: γ-cyclodextrin, γ-dextrin, cyclooctaamylose, cyclomaltooctaose, γ-cycloamylase

Chemical name: Cyclooctaamylose

CAS number: 17465-86-0

Chemical formula: \((\text{C}_6\text{H}_{10}\text{O}_5)^8\)

Assay: ≥ 98 % (dry basis)

**Identification:**

Melting range: Decomposes above 285 °C

Solubility: Freely soluble in water; very slightly soluble in ethanol

Specific rotation: [α]D 25: between +174° and +180° (1 % solution)

**Purity:**

Water: ≤ 11 %

Residual complexant (8-cyclohexadecen-1-one (CHDC)): ≤ 4 mg/kg

Residual solvent (n-decane): ≤ 6 mg/kg

Reducing substances: ≤ 0.5 % (as glucose)

Sulphated ash: ≤ 0.1 %

**Dextran preparation produced by Leuconostoc mesenteroides**

2′-Fucosyllactose (microbial source)

**Definition:**
Chemical name: α-L-Fucopyranosyl-(1→2)-β-D-galactopyranosyl-(1→4)-D-glucopyranose
Chemical formula: C_{18}H_{32}O_{15}
CAS No: 41263-94-9
Molecular weight: 488.44 g/mol

**Source:**
Genetically modified strain of Escherichia coli K-12

**Description:**
2′-Fucosyllactose is a white to off-white crystalline powder that is produced by a microbial process. 2′-Fucosyllactose is isolated by crystallisation.

**Purity:**
2′-Fucosyllactose: ≥ 94 %
D-Lactose: ≤ 3,0 %
L-Fucose: ≤ 1,0 %
Difucosyl-D-lactose: ≤ 1,0 %
2′-Fucosyl-D-lactulose: ≤ 1,0 %
pH (20 °C, 5 % solution): 3,2-5,0
Water: ≤ 5,0 %
Ash, sulphated: ≤ 1,5 %
Acetic acid: ≤ 1,0 %
Residual proteins: ≤ 0,01 %

**Description:**
2′-Fucosyllactose is a white to off white powder and the liquid concentrate (45 % ± 5 % w/v) aqueous solution is a colourless to slight yellow clear aqueous solution. 2′-Fucosyllactose is produced by a microbiological process. 2′-Fucosyllactose is isolated by spray drying.

**Purity:**
2′-Fucosyllactose: ≥ 90 %
Lactose: ≤ 5,0 %
Fucose: ≤ 3,0 %
3-Fucosyllactose: ≤ 5,0 %
Fucosylgalactose: ≤ 3,0 %
Difucosyllactose: ≤ 5,0 %
Glucose: ≤ 3,0 %
Galactose: ≤ 3,0 %
Water: ≤ 9,0 % (powder)
Ash, sulphated: ≤ 0,5 % (powder and liquid)
Residual proteins: ≤ 0,01 % (powder and liquid)

pH for 10g/L, at 25 °C - 5-7,5

(*) The measurements of viscosity are carried out under the following conditions: 1 %, 25 °C, 20 rpm

**Heat-treated milk products fermented with Bacteroides xylanisolvens**

**Description/Definition:**
Heat-treated fermented milk products are produced with *Bacteroides xylanisolvens* (DSM 23964) as starter culture.

Semi-skimmed milk (between 1.5 % and 1.8 % fat) or skimmed milk (0.5 % fat or less) is pasteurised or ultra-heat-treated before starting the fermentation with *Bacteroides xylanisolvens* (DSM 23964). The resulting fermented milk product is homogenised and then heat-treated to inactivate *Bacteroides xylanisolvens* (DSM 23964). The final product does not contain viable cells of *Bacteroides xylanisolvens* (DSM 23964) (*).

(*) Modified DIN EN ISO 21528-2.

**Hydroxytyrosol**

**Description/Definition:**
Hydroxytyrosol is a pale yellow viscous liquid obtained by chemical synthesis

Molecular formula: C₁₀H₁₆O₃

**Ice Structuring Protein type III HPLC 12**

**Description/Definition:**
The Ice Structuring Protein (ISP) preparation is a light-brown liquid produced by submerged fermentation of a genetically-modified strain of food-grade baker's yeast (*Saccharomyces cerevisiae*) in which a synthetic gene for the ISP has been inserted into the yeast's genome. The protein is expressed and secreted into the growth medium where it is separated from the yeast cells by micro-filtration and concentrated by ultra-filtration. As a result, the yeast cells are not transferred into the ISP preparation as such or under an altered form. The ISP preparation consists of native ISP, glycosylated ISP and proteins and peptides from the yeast and sugars as well as acids and salts commonly found in food. The concentrate is stabilised with 10 mM citric acid buffer.

Assay: ≥ 5 g/l active ISP
pH: 2.5-3.5
Ash: ≤ 2.0 %
DNA: Not detectable

### Lucerne leaf extract from *Medicago sativa*

**Description/Definition:**
The Lucerne (*Medicago sativa* L.) is processed within 2 hours after harvest. It is chopped and crushed. By passing through an oleaginous-type press, the Lucerne provides a fibrous residue and press juice (10 % of dry matter). The dry matter of this juice contains about 35 % of crude protein. The press juice (pH 5.8-6.2) is neutralised. Preheating and vapour injection allows coagulation of proteins associated with carotenoid and chlorophyll pigments. The protein precipitate is separated by centrifugation and thereafter dried. After adding ascorbic acid the Lucerne protein concentrate is granulated and stored in inert gas or in cold storage.

**Composition:**
- Protein: 45-60 %
- Fat: 9-11 %
- Free carbohydrates (soluble fibre): 1-2 %
- Polysaccharides (insoluble fibre): 11-15 %
  - including cellulose: 2-3 %
- Minerals: 8-13 %
- Saponins: ≤ 1.4 %
- Isoflavones: ≤ 350 mg/kg
- Coumestrol: ≤ 100 mg/kg
- Phytates: ≤ 200 mg/kg
- L-canavanine: ≤ 4.5 mg/kg

### Lycopene

**Description/Definition:**
Synthetic lycopene is produced by the Wittig condensation of synthetic intermediates commonly used in the production of other carotenoids used in food. Synthetic lycopene consists of ≥ 96 % lycopene and minor quantities of other related carotenoid components. Lycopene is presented either as a powder in a suitable matrix or an oily dispersion. The colour is dark red or red-violet. Antioxidative protection has to be assured.

- Chemical name: Lycopene
- CAS No.: 502-65-8 (all-trans lycopene)
- Chemical formula: C_{40}H_{54}
- Formula weight: 536.85 Da

**Magnolia Bark Extract**

**Description/Definition:**
Magnolia bark extract is obtained from the bark of the plant *Magnolia officinalis* L. and produced with supercritical carbon dioxide. The bark is washed and oven dried to reduce moisture content before being crushed and extracted with supercritical carbon dioxide. The extract is dissolved in medical-grade ethanol and re-crystallised to yield magnolia bark extract.

Magnolia bark extract is mainly composed of two phenolic compounds, magnolol and honokiol.

**Appearance:** Light brownish powder

**Purity:**
- Magnolol: ≥ 85,2 %
- Honokiol: ≥ 0,5 %
- Magnolol & Honokiol: ≥ 94 %
- Total Eudesmol: ≤ 2 %
- Moisture: 0,50 %

**Maize-germ oil high in unsaponifiable matter**

**Description/Definition:**
Maize-germ oil high in unsaponifiable matter is produced by vacuum distillation and it is different from refined maize-germ oil in the concentration of the unsaponifiable fraction (1,2 g in refined maize-germ oil and 10 g in ‘maize-germ oil high in unsaponifiable matter’).

**Purity:**
Unsaponifiable matter: > 9,0 g/100 g
Tocopherols: ≥ 1,3 g/100 g
α-tocopherol (%): 10-25 %
β-tocopherol (%): < 3,0 %
γ-tocopherol (%): 68-89 %
δ-tocopherol (%): < 7,0 %
Sterols, triterpenic alcohols, methylsterols: > 6,5 g/100 g
Fatty acids in triglycerides:
palmitic acid: 10,0-20,0 %
stearic acid: < 3,3 %
oleic acid: 20,0-42,2 %
linoleic acid: 34,0-65,6 %
linolenic acid: < 2,0 %
Acid value: ≤ 6,0 mg KOH/g
Peroxide value: ≤ 10 mEq O₂/kg

**Heavy metals:**
Iron (Fe): < 1 500 µg/kg
Copper (Cu): < 100 µg/kg

**Impurities:**
Polycyclic aromatic hydrocarbons (PAH) Benzo(a)pyrene: < 2 µg/kg
Treatment with active carbon is required to ensure that polycyclic aromatic hydrocarbons (PAH) are not enriched in the production of ‘maize-germ oil high in unsaponifiable matter’
**Methylcellulose**

**Description/Definition:**
Methyl cellulose is cellulose obtained directly from natural strains of fibrous plant material and partially etherified with methyl groups.

Chemical name: Methyl ether of cellulose

Chemical formula: The polymers contain substituted anhydroglucose units with the following general formula: C₆H₇O₂(R₁)(OR₂)(OR₃) where R₁, R₂, R₃ each may be one of the following:

- H
- CH₃ or
- CH₂CH₃

Molecular weight: Macromolecules: from about 20 000 (n about 100) up to about 380 000 g/mol (n about 2 000)

Assay: Content not less than 25 % and not more than 33 % of methoxyl groups (-OCH₃) and not more than 5 % of hydroxyethoxyl groups (-OCH₂CH₂OH)

Slightly hygroscopic white or slightly yellowish or greyish odourless and tasteless, granular or fibrous powder.

Solubility: Swelling in water, producing a clear to opalescent, viscous, colloidal solution. Insoluble in ethanol, ether and chloroform. Soluble in glacial acetic acid.

**Purity:**

Loss on drying: ≤ 10 % (105 °C, 3 hours)

Sulphated Ash: ≤ 1,5 % determined at 800 ± 25 °C

pH: ≥ 5,0 and ≤ 8,0 (1 % colloidal solution)

**Heavy metals:**

Arsenic: ≤ 3,0 mg/kg

Lead: ≤ 2,0 mg/kg

Mercury: ≤ 1,0 mg/kg

Cadmium: ≤ 1,0 mg/kg

---

**(6S)-5-methyltetrahydrofolic acid, glucosamine salt**

**Description/Definition:**

Chemical name: N-[4-[[[(6S)-2-amino-1,4,5,6,7,8-hexahydro-5-methyl-4-oxo-6-pteridinyl]methyl]amino]benzoyl]-L-glutamic acid, glucosamine salt

Chemical formula: C₃₂H₅₁N₉O₁₆

Molecular weight: 817,80 g/mol (anhydrous)

CAS No.: 1181972-37-1

Appearance: Creamy to light-brown powder

| **Mycelial extract from Shiitake mushroom** *(Lentinula edodes)* | **Description/Definition:**  
The novel food ingredient is a sterile aqueous extract obtained from the mycelium of *Lentinula edodes* cultivated in a submerged fermentation. It is a light brown, slightly turbid liquid.  
Lentinan is a β-(1-3) β-(1-6)-D-glucan which has a molecular weight of approximately $5 \times 10^5$ Daltons, a degree of branching of 2/5 and a triple helical tertiary structure.  
**Purity/Composition of the mycelial extract from *Lentinula edodes***:  
- Moisture: 98 %  
- Dry matter: 2 %  
- Free glucose: < 20 mg/ml  
- Total protein (*): < 0.1 mg/ml  
- N-containing constituents (**): < 10 mg/ml  
- Lentinan: 0.8 – 1.2 mg/ml  

(*) Bradford method  
(**) Kjeldahl method |
| **Noni fruit juice** *(Morinda citrifolia)*              | **Description/Definition:**  
Noni fruits (fruits of *Morinda citrifolia* L.) are pressed. The obtained juice is pasteurised. An optional fermentation step before or after the pressing may occur.  
Rubiadin: ≤ 10 µg/kg  
Lucidin: ≤ 10 µg/kg |
| **Noni fruit juice powder** *(Morinda citrifolia)*       | **Description/Definition:**  
Seeds and skin of the sun-dried fruits of *Morinda citrifolia* are separated. The obtained pulp is filtered to separate juice from the flesh. Desiccation of the produced juice occurs in one or two ways:  
Either by atomisation using maize maltodextrins, this mixture is obtained by keeping the rates of inflow of the juice and maltodextrins constant  
Or by zeodratation or drying and then mixing with an excipient, this process allows the juice to be dried initially and then mixed with maltodextrins (same amount as used in atomisation). |
| **Noni fruit puree and concentrate** *(Morinda citrifolia)* | **Description/Definition:**  
The fruits of *Morinda citrifolia* are harvested by hand. Seeds and skin may be separated mechanically from the pureed fruits. After pasteurisation, the puree is packaged in aseptic containers and stored under cold conditions. |
Morinda citrifolia concentrate is prepared from M. citrifolia puree by treatment with pectinolytic enzymes (50-60 °C for 1-2 h). Then the puree is heated to inactivate the pectinases and then immediately cooled. The juice is separated in a decanter centrifuge. Afterwards the juice is collected and pasteurised, prior to being concentrated in a vacuum evaporator from a brix of 6 to 8 to a brix of 49 to 51 in the final concentrate.

**Composition:**

**Puree:**
- Moisture: 89-93 %
- Protein: ≤ 0.6 g/100 g
- Fat: ≤ 0.4 g/100 g
- Ash: < 1.0 g/100 g
- Total carbohydrates: 5-10 g/100 g
- Fructose: 0.5-3.82 g/100 g
- Glucose: 0.5-3.14 g/100 g
- Dietary fibre: < 0.5-3 g/100 g
- 5,15-dimethylmorindol (*): ≤ 0.254 µg/ml
- Lucidin (*): Not detectable
- Alizarin (*): Not detectable
- Rubiadin (*): Not detectable

**Concentrate:**
- Moisture: 48-53 %
- Protein: 3-3.5 g/100 g
- Fat: < 0.04 g/100 g
- Ash: 4.5-5.0 g/100 g
- Total carbohydrates: 37-45 g/100 g
- Fructose: 9-11 g/100 g
- Glucose: 9-11 g/100 g
- Dietary fibre: 1.5-5.0 g/100 g
- 5,15-dimethylmorindol (*): ≤ 0.254 µg/ml

(*): By an HPLC-UV method developed and validated for the analysis of anthraquinones in Morinda citrifolia puree and concentrate. Limits of detection: 2.3 ng/ml (5,15 dimethylmorindol); 50.0 ng/ml (lucidin); 6.3 ng/ml (alizarin) and 62.5 ng/ml (rubiadin).

#### Phosphated maize starch

**Description/Definition:**

Phosphated maize starch (phosphated distarch phosphate) is a chemically modified resistant starch derived from high amylose starch by combining chemical treatments to create phosphate cross-links between carbohydrate residues and esterified hydroxyl groups.

The novel food ingredient is a white or nearly white powder.

CAS No: 11120-02-8

Chemical formula: $(C_6H_{10}O_5)_n \cdot [(C_6H_{10}O_5)_2PO_3H] \cdot [(C_6H_{10}O_5)PO_3H_2]^x \cdot [(C_6H_{10}O_5)PO_3H]^y$

$n =$ number of glucose units; $x, y =$ degrees of substitution

The chemical characteristics of phosphated distarch phosphate:

- Loss on drying: 10-14 %
- pH: 4.5-7.5
- Dietary fibre: ≥ 70 %
- Starch: 7-14 %
- Protein: ≤ 0.8 %
- Lipids: ≤ 0.8 %
- Residual bound phosphorus: ≤ 0.4 % (as phosphorus) ‘high amylose maize’ as source

| Phosphatidylserine from fish phospholipids | **Description/Definition:**
The novel food ingredient is yellow to brown powder. Phosphatidylserine is obtained from fish phospholipids by an enzymatic transphosphorylation with the amino acid L-serine.  

**Specification of the phosphatidylserine product manufactured from fish phospholipids:**
- Moisture: < 5.0 %  
- Phospholipids: ≥ 75 %  
- Phosphatidylserine: ≥ 35 %  
- Glycerides: < 4.0 %  
- Free L-serine: < 1.0 %  
- Tocopherols: < 0.5 % (†)  
- Peroxide value: < 5.0 meq O₂/kg  

(†) Tocopherols may be added as antioxidants according to Commission Regulation (EU) No 1129/2011 |

| Phosphatidylserine from soya phospholipids | **Description/Definition:**
The novel food ingredient is off-white to light yellow powder. It is also available in liquid form with a clear brown to orange colour. The liquid form contains medium chain triacylglycerides (MCT) as a carrier. It contains lower levels of Phosphatidylserine due to the fact that it includes significant amounts of oil (MCT).  

Phosphatidylserine from soya phospholipids is obtained through enzymatic transphosphatidylation of high-phosphatidylcholine soybean lecithin with the amino acid L-serine. Phosphatidylserine consists of a glycerophosphate skeleton conjugated with two fatty acids and L-serine via a phosphodiester linkage.  

**Characteristics of Phosphatidylserine from soya phospholipids:**

**Powder form:**
- Moisture: < 2.0 %  
- Phospholipids: ≥ 85 %  
- Phosphatidylserine: ≥ 61 %  
- Glycerides: < 2.0 %  
- Free L-serine: < 1.0 %  
- Tocopherols: < 0.3 %  
- Phytosterols: < 0.2 %  

**Liquid form:**
- Moisture: < 2.0 %  
- Phospholipids: ≥ 25 % |

### Phospholipid product containing equal amounts of phosphatidylserine and phosphatidic acid

**Description/Definition:**
The product is manufactured through enzymatic conversion of soy lecithin. The phospholipid product is a highly concentrated, yellow-brown powder form of phosphatidylserine and phosphatidic acid at an equal level.

**Specification of the product:**
- Moisture: ≤ 2,0 %
- Total phospholipids: ≥ 70 %
- Phosphatidylserine: ≥20 %
- Phosphatidic acid: ≥ 20 %
- Glycerides: ≤ 1,0 %
- Free L-serine: ≤ 1,0 %
- Tocopherols: ≤ 0,3 %
- Phytosterols: ≤ 2,0 %
- Silicon dioxide is used with a maximum content of 1,0 %

### Phospholipides from egg yolk

85 % and 100 % pure Phospholipides from egg yolk

### Phytoglycogen

**Description:**
White to off-white powder which is an odourless, colourless, flavourless polysaccharide derived from non-GM sweet corn using conventional food processing techniques

**Definition:**
Glucose polymer \((C_6H_{12}O_6)_n\) with linear linkages of \(\alpha(1 – 4)\) glycosidic bonds branched every 8 to 12 glucose units by \(\alpha(1 – 6)\) glycosidic bonds

**Specifications:**
- Carbohydrates: 97 %
- Sugars: 0,5 %
- Fibre: 0,8 %
- Fat: 0,2 %
- Protein: 0,6 %

Prolyl oligopeptidase (enzyme preparation)

**Specification of the enzyme:**
- Systematic name: Prolyl oligopeptidase
- Synonyms: Prolyl endopeptidase, proline-specific endopeptidase, endoprolylpeptidase
- Molecular weight: 66 kDa
- Enzyme Commission number: EC 3.4.21.26
- CAS number: 72162-84-6
- Source: A genetically modified strain of Aspergillus niger (GEP-44)

**Description:**
Prolyl oligopeptidase is available as an enzyme preparation containing approximately 30% maltodextrin.

**Specifications of the enzyme preparation of prolyl oligopeptidase:**
- Activity: > 580 000 PPI (*/g > 34,8 PPU (**)/g)
- Appearance: Microgranulate
- Colour: Off-white to orange yellowish. The colour may change from batch to batch
- Dry Matter: > 94%
- Gluten: < 20 ppm

**Heavy metals:**
- Lead: ≤ 1,0 mg/kg
- Arsenic: ≤ 1,0 mg/kg
- Cadmium: ≤ 0,5 mg/kg
- Mercury: ≤ 0,1 mg/kg

**Microbiological criteria:**
- Total aerobic plate count: ≤ 10³ CFU/g
- Total yeasts and moulds: ≤ 10² CFU/g
- Sulphite reducing anaerobes: ≤ 30 CFU/g
- Enterobacteriaceae: < 10 CFU/g
- Salmonella: Absence in 25 g

- Staphylococcus aureus: Absence in 10 g
- Pseudomonas aeruginosa: Absence in 10 g
- Listeria monocytogenes: Absence in 25 g
- Antimicrobial activity: Absent
Protein extract from pig kidneys

**Description/Definition:**
The protein extract is obtained from homogenised pig kidneys through a combination of salt precipitation and high speed centrifugation. The obtained precipitate contains essentially proteins with 7% of the enzyme diamine oxidase (enzyme nomenclature E.C. 1.4.3.22) and is resuspended in a physiologic buffer system. The obtained pig kidney extract is formulated as encapsulated enteric coated pellets to reach the active sites of digestion.

**Basic Product:**
- Specification: pig kidney protein extract with natural content of Diamin oxidase (DAO):
- Physical condition: liquid
- Colour: brownish
- Appearance: slightly turbid solution
- pH value: 6,4-6,8
- Enzymatic activity: > 2 677 kHDU DAO/ml (DAO REA (DAO Radioextraction assay))

**Microbiological criteria:**
- *Brachyspira* spp.: negative (Real Time PCR)
- *Listeria monocytogenes*: negative (Real Time PCR)
- *Staphylococcus aureus*: < 100 CFU/g
- *Influenza A*: negative (Reverse Transcription Real Time PCR)
- *Escherichia coli*: < 10 CFU/g
- Total aerobic microbiological count: < 10⁵ CFU/g
- Yeasts/moulds count: < 10⁵ CFU/g
- *Salmonella*: Absence/10g
- Bile salt resistant enterobacteriaceae: < 10⁴ CFU/g

**Final product:**
- Specification pig kidney protein extract with natural content of DAO (E.C. 1.4.3.22) in an enteric coated formulation:
- Physical condition: solid
- Colour: yellow gray
**Authorised Novel Food**

**Appearance:** micropellets

**Enzymatic activity:** 110-220 kHDU DAO/g pellet (DAO REA (DAO Radioextraction assay))

**Acid stability:** 15 min 0.1M HCl followed by 60 min Borat pH=9.0: > 68 kHDU DAO/g pellet (DAO REA (DAO Radioextraction assay))

**Humidity:** < 10 %

**Staphylococcus aureus:** < 100 CFU/g

**Escherichia coli:** < 10 CFU/g

**Total aerobic microbiological count:** < 10⁴ CFU/g

**Total combined yeasts/moulds count:** < 10³ CFU/g

**Salmonella:** Absence/10g

**Bile salt resistant enterobacteriaceae:** < 10² CFU/g

---

**Rapeseed oil high in unsaponifiable matter**

**Description/Definition:**

‘Rapeseed oil high in unsaponifiable matter’ is produced by vacuum distillation and it is different from refined rapeseed oil in the concentration of the unsaponifiable fraction (1 g in refined rapeseed oil and 9 g in ‘rapeseed oil high in unsaponifiable matter’). There is a minor reduction of triglycerides containing monounsaturated and polyunsaturated fatty acids.

**Purity:**

- **Unsaponifiable matter:** > 7.0 g/100 g
- **Tocopherols:** > 0.8 g/100 g
- **α-tocopherol (%):** 30-50 %
- **γ-tocopherol (%):** 50-70 %
- **δ-tocopherol (%):** < 6.0 %
- **Sterols, triterpenic alcohols, methylsterols:** > 5.0 g/100 g

**Fatty acids in triglycerides:**

- **Palmitic acid:** 3-8 %
- **Stearic acid:** 0.8-2.5 %
- **Oleic acid:** 50-70 %
- **Linoleic acid:** 15-28 %
- **Linolenic acid:** 6-14 %
- **Erucic acid:** < 2.0 %

**Acid value:** ≤ 6.0 mg KOH/g

**Peroxide value:** ≤ 10 mEq O₂/kg

### Sacha Inchi oil from *Plukenetia volubilis*

**Description/Definition:**
Sacha inchi oil is a 100 % cold pressed vegetable oil obtained from the seeds of *Plukenetia volubilis* L. It is a transparent, fluid (liquid) and shiny oil at room temperature. It has a fruity, light, green vegetable taste without undesirable flavours.

- Aspect, limpidity, shine, colour: Fluid at room temperature, clean, shiny yellow gold
- Odour and taste: Fruity, vegetable without non acceptable taste or odour

**Purity:**
- Water and Volatiles: < 0.2 g/100 g
- Impurities insoluble in hexane: < 0.05 g/100 g
- Oleic acidity: < 2.0 g/100 g
- Peroxide value: < 15 meq O_2/kg
- Trans fatty acids: < 1.0 g/100 g
- Total unsaturated fatty acids: > 90 %

**Salatrim**

**Description/Definition:**
Salatrim is the internationally recognised acronym for (short and long chain acyl triglyceride molecules). Salatrim is prepared by non-enzymatic inter-esterification of triacetin, tripropionin, tributyrin, or their mixtures with hydrogenated canola, soybean, cottonseed, or sunflower oil. Description: Clear, slightly amber liquid to a light coloured waxy solid at room temperature. Free of particulate matter and of foreign or rancid odour.

**Glycerol ester distribution:**
- Triacylglycerols: > 87 %
- Diacylglycerols: ≤ 10 %
- Monoacylglycerols: ≤ 2.0 %

**Fatty acid composition:**
- MOLE % LCFA (long chain fatty acids): 33-70 %
- MOLE % SCFA (short chain fatty acids): 30-67 %
- Saturated long chain fatty acids: < 70 % by weight
- Trans fatty acids: ≤ 1.0 %
- Free fatty acids as oleic acid: ≤ 0.5 %

**Triacylglycerol profile:**
- Triesters (short/long of 0.5 to 2.0): ≥ 90 %
- Triesters (short/long = 0): ≤ 10 %
- Unsaponifiable material: ≤ 1.0 %

**Unsaponifiable material:**
- ≤ 0.3 %
- ≤ 3.5 Red (Lovibond)
- ≤ 2.0 Meq/Kg

| **Fermented soybean extract** | **Description/Definition:**
Fermented soybean extract is an odourless milk-white coloured powder. It is comprised of 30 % fermented soybean extract powder and 70 % resistant dextrin (as carrier) from corn-starch, which is added during the processing. Vitamin K₂ is removed during the manufacturing process. Fermented soybean extract contains nattokinase isolated from natto, a foodstuff produced by the fermentation of non-genetically modified soybeans (*Glycine max* (L.)) with a selected strain of *Bacillus subtilis* var. natto.

Nattokinase activity: 20 000–28 000 Fibrin degradation unit/g (*)

Identity: Confirmable

Condition: No offensive taste or smell

Loss on drying: ≤ 10 %

Vitamin K₂: ≤ 0,1 mg/kg

**Sucromalt**

**Description/Definition:**
Sucromalt is a complex mixture of saccharides which is produced from sucrose and a starch hydrolysate by means of an enzymatic reaction. In this process, glucose units are attached to saccharides from the starch hydrolysate by means of an enzyme produced by the bacterium *Leuconostoc citreum* or by means of a recombinant strain of the production organism *Bacillus licheniformis*. The resulting oligosaccharides are characterised by the presence of α-(1→6) and α-(1→3) glycosidic compounds. The overall product is syrup, in addition to these oligosaccharides, contains mainly fructose but also the disaccharide leucrose and other disaccharides.

Total solids: 75-80 %
Moisture: 20-25 %
Sulphatase: Max 0.05 %
pH: 3.5-6.0
Conductivity < 200 (30 %)
Nitrogen < 10 ppm
Fructose: 35-45 % d.w.
Leucrose: 7-15 % d.w.
Other disaccharides: Max 3 %
Higher saccharides: 40-60 % d.w.

**Sugar cane fibre**

**Description/Definition:**
Sugar Cane Fibre is derived from the dry cell wall or fibrous residue remaining after expression or extraction of sugar juice from sugar cane, of the Saccharum genotype. It consists primarily of cellulose and hemicellulose.

The production process consists of several steps, including: chipping, alkaline digestion, removal of lignins and other non-cellulosic components, bleaching of purified fibres, acid washing and neutralization.

(*) Taxifolin in its hydrated form and during the drying process is a crystal. This results on the inclusion of water of crystallisation in a quantity of 1,5 %.
Trehalose

Description/Definition:
A non-reducing disaccharide that consists of two glucose moieties linked by an α-1,1-glucosidic bond. It is obtained from liquefied starch by a multistep enzymatic process. The commercial product is the dihydrate. Virtually odourless, white or almost white crystals with a sweet taste

Synonyms: α,α-trehalose
Chemical name: α-D-glucopyranosyl-α-D-glucopyranoside, dihydrate
CAS No.: 6138-23-4 (dihydrate)
Chemical formula: C₁₂H₂₂O₁₁ · 2H₂O (dihydrate)
Formula weight: 378,33 (dihydrate)
Assay: ≥ 98 % on the dry basis

Determine using an atomic absorption technique appropriate to the specified level. The selection of sample size and method of sample preparation may be based on the principles of the method described in FNP 5 (1), 'Instrumental methods'

Method of assay:
Principle: trehalose is identified by liquid chromatography and quantified by comparison to a reference standard containing standard trehalose
Preparation of sample solution: weigh accurately about 3 g of dry sample into a 100 ml volumetric flask and add about 80 ml of purified, deionised water. Bring sample to complete dissolution and dilute to mark with purified deionised water. Filter through a 0.45 micron filter
Preparation of standard solution: dissolve accurately weighed quantities of dry standard reference trehalose in water to obtain a solution having known concentration of about 30 mg of trehalose per ml.
Apparatus: liquid chromatography equipped with a refractive index detector and integrating recorder
Conditions:
Column: Shodex Ionpack KS-801 (Showa Denko Co.) or equivalent
— length: 300 mm
— diameter: 10 mm
— temperature: 50 °C
Mobile phase: water
flow rate: 0.4 ml/min
Injection volume: 8 µl
Procedure: inject separately equal volumes of the sample solution and the standard solution into the chromatograph.
Record the chromatograms and measure the size of response of the trehalose peak
Calculate the quantity, in mg, of trehalose in 1 ml of the sample solution by the following formula:
% trehalose = 100 × (R_u/R_s) (W_s/W_u)

**UV-treated bread**

**Description/Definition:**

UV-treated bread is yeast leavened bread and rolls (without toppings) to which a treatment with ultraviolet radiation is applied after baking in order to convert ergosterol to vitamin D₂ (ergocalciferol).

UV radiation: A process of radiation in ultraviolet light within the wavelength of 240-315 nm for maximum of 5 seconds with energy input of 10-50 mJ/cm².

**Vitamin D₂**

Chemical name: $(5Z,7E,22E)-3S-9,10$-secocergosta-5,7,10(19),22-tetraen-3-ol  
Synonym: Ergocalciferol  
CAS No: 50-14-6  
Molecular weight: 396.65 g/mol  

**Contents:**

Vitamin D₂ (ergocalciferol) in the final product: 0.75-3 µg/100 g (*)  
Yeast in dough: 1-5 g/100 g (**)  

(*) EN 12821, 2009, European Standard.  
(**) Recipe calculation.

**UV-treated milk**

**Description/Definition:**

UV-treated milk is cow's milk (whole and semi-skimmed) to which a treatment with ultraviolet (UV) radiation via turbulent flow is applied after pasteurisation. The treatment of the pasteurised milk with UV radiation results in an increase in the vitamin D₃ (cholecalciferol) concentrations by conversion of 7-dehydrocholesterol to vitamin D₃.

UV radiation: A process of radiation in ultraviolet light within the wavelength of 200-310 nm with energy input of 1 045 J/l.
**Vitamin D₃**

Chemical name: \((1S,3Z)-3-[(2E)-2-[(1R,3aS,7aR)-7a-methyl-1-[(2R)-6-methylheptan-2-yl]-2,3,3a,5,6,7-hexahydro-1H-inden-4-ylidene]ethylidene]-4-methylidenecyclohexan-1-ol\)

Synonym: Cholecalciferol

CAS No: 67-97-0

Molecular weight: 384.6377 g/mol

**Contents:**

Vitamin D₃ in the final product:

- Whole milk (*): 0.5-3.2 µg/100 g (**)
- Semi-skimmed milk (*): 0.1–1.5 µg/100 g (**)

(**) HPLC

---

**Vitamin K₂ (menaquinone)**

This novel food is produced by a synthetic or microbiological process.

**Specification of synthetic Vitamin K₂ (menaquinone-7)**

Chemical Name: \((\text{all-E})-2-(3,7,11,15,19,23,27-\text{Heptamethyl}-2,6,10,14,18,22,26-\text{octacosaheptaenyl})-3-\text{methyl-1,4-naphtalenedione}\)

CAS Number: 2124-57-4

Molecular formula: \(C_{46}H_{64}O_2\)

Molecular weight: 649 g/mol

Appearance: Yellow powder

Purity: Max 6.0 % cis-isomer, max 2.0 % other impurities

Content: 97-102 % Menaquinone-7 (including at least 92 % all-trans Menaquinone-7)

**Specifications of microbiologically produced Vitamin K₂ (menaquinone-7)**

Source: *Bacillus subtilis* spp. natto

Vitamin K₂ (2-methyl-3-all-trans-polyprenyl-1,4-naphthoquinones), or the menaquinone series, is a group of prenylated naphthoquinone derivatives. The number of isoprene residues, where 1 isoprene unit consists of 5 carbons comprising the side chain, is used to characterise the menaquinone homologues. It is presented in an oil suspension that primarily contains MK-7 and MK-6 to a smaller extent.

Vitamin K₂ (menaquinones) series with menaquinone-7 (MK-7)(\(n = 6\)) being \(C_{46}H_{64}O_2\), menaquinone-6 (MK-6)(\(n = 5\)) being \(C_{41}H_{56}O_2\) and menaquinone-4 (MK-4)(\(n = 3\)) being \(C_{31}H_{40}O_2\).

| **Wheat bran extract** | **Description/Definition:**  
White crystalline powder obtained by enzymatic extraction from *Triticum aestivum* L. bran, rich in arabinoxylan oligosaccharides  
- Dry matter: Min. 94%  
- Arabinoxylan oligosaccharides: Min 70% of dry matter  
- Average degree of polymerisation of arabinoxylan oligosaccharides: 3-8  
- Ferulic acid (bound to arabinoxylan oligosaccharides): 1-3% of dry matter  
- Total poly/oligosaccharides: Min 90%  
- Protein: Max 2% of dry matter  
- Ash: Max 2% of dry matter  
**Microbiological parameters:**  
- Mesophilic bacteria – total count: Max 10,000/g  
- Yeasts: Max 100/g  
- Fungi: Max 100/g  
- *Salmonella*: Absence in 25 g  
- *Bacillus cereus*: Max 1,000/g  
- *Clostridium perfringens*: Max 1,000/g |

| **Yeast beta-glucans** | **Description/Definition:**  
Beta-glucans are complex, high molecular mass (100–200 kDa) polysaccharides, found in the cell wall of many yeasts and cereals.  
- The chemical name for ‘yeast beta-glucans’ is (1-3),(1-6)-β-D-glucans.  
- Beta-glucans consist of a backbone of β-1-3-linked glucose residues that are branched by β-1-6-linkages, to which chitin and mannoproteins are linked by β-1-4-bonds.  
- Beta-glucans are isolated from yeast *Saccharomyces cerevisiae*.  
- The tertiary structure of the glucan cell wall of *Saccharomyces cerevisiae* consists of chains of β-1,3-linked glucose residues, branched by β-1,6-linkages, forming a backbone to which are linked chitin via β-1,4-bonds, β-1,6-glucans and some mannoproteins.  
- This novel food is available in three different forms: soluble, insoluble and insoluble in water, but dispersible in many liquid matrices.  
**Chemical characteristics yeast (*Saccharomyces cerevisiae*) beta-glucans:**  
**Soluble form:**  
- Total carbohydrates: > 75% |
